

## STW1.0: SAT>IP (RTSP) streaming server with 1 tuners for DVB-T

The system is actually an RTSP server based on DVB-T, the way to communicate with it is in accordance with SAT>IP protocols, in the same way that software like  VLC,  DVBViewer, It is easy to connect with it and use it as a player. The system is designed in an industrial way, based on a micro-controller chip and with an economic approach. In such a way that the final board, in addition to providing quality and reliable service, also has the ability to compete in terms of the finished price of the product. Common and widely used parts are used in system design.

- Ability to set and use in both **AP** and **Client** modes
- Support for popular players such as **VLC** and **DVBViewer** in Windows, Linux environment
- Support for **VLC** and **IPTV** players in the Android environment
- Native design and manufacturing and the possibility of making customized changes in software and hardware according to customer needs
